Although Mississippi has not historically had a large immigrant population, the number of foreign-born residents living in the state today is far greater than it was several decades ago. In 1990, Mississippi was home to roughly 20,000 immigrants, a group that made up less than 1 percent of the population. Today, the picture looks strikingly different. The number of immigrants living in Mississippi has more than tripled since 1990, and foreign-born residents now account for 2.1 percent of the state’s population overall. Much of this change, however, occurred before 2010. From 2010 to 2014, the number of immigrants living in Mississippi remained essentially flat, indicating the state may want to adopt policies aimed at attracting immigrants in the coming years.

The number of immigrants living in Mississippi has more than tripled since 1990, and foreign-born residents now account for 2.1% of the state’s population overall.

Today Mississippi is home to more than 63,000 new Americans. Such immigrants serve as everything from entrepreneurs to sewing machine operators, making them critical contributors to Mississippi’s economic success overall.

63,051
Mississippi residents were born abroad.

Mexico
India
Vietnam
are the top three countries of origin of Mississippi immigrants.
Given that the act of picking up and moving to another country is inherently brave and risky, it should be little surprise that immigrants have repeatedly been found to be more entrepreneurial than the U.S. population as a whole. According to The Kauffman Foundation, a nonprofit group that studies entrepreneurship, immigrants were almost twice as likely to start a new business in 2015 than the native-born population.

The companies they founded ranged from small businesses on Main Street to large firms responsible for thousands of American jobs. Recent studies, for instance, have indicated that immigrants own more than half of the grocery stores in America and 48 percent of nail salons. Foreign-born entrepreneurs are also behind 51 percent of our country’s billion dollar startups. More than 40 percent of Fortune 500 firms have at least one founder who was an immigrant or the children of immigrants.

In 2010, roughly 1 in 10 American workers with jobs at private firms were employed at immigrant-founded companies.

The super-charged entrepreneurial activity of immigrants provides real and meaningful benefits to everyday Americans. In 2010, roughly one in 10 American workers with jobs at private firms were employed at immigrant-founded companies. Such businesses also generated more than $775 billion in annual business revenue that year. In Mississippi like the country as a whole, immigrants are currently punching above their weight class as entrepreneurs. Foreign-born workers currently make up 5.4 percent of all entrepreneurs in the state, despite being just 2.1 percent of Mississippi’s population. The more than 5,800 foreign-born entrepreneurs in Mississippi also create

jobs and economic opportunity for U.S.-born workers. Their firms generated $81.6 million in business income in 2014. Mississippi firms with at least one immigrant owner also provided jobs to almost 18,000 Americans in 2007.

Currently, there is no visa to come to America, start a company, and create jobs for U.S. workers—even if an entrepreneur already has a business plan and has raised hundreds of thousands of dollars to support his or her idea. Trying to exploit that flaw in our system, countries around the world—from Canada to Singapore, Australia to Chile—have enacted startup visas, often with the explicit purpose of luring away entrepreneurs who want to build a U.S. business but cannot get a visa to do so. Here in the United States, many individuals have gone to great lengths to circumnavigate the visa hurdles. Many entrepreneurs sell a majority stake in their company and then apply for a visa as a high-skilled worker, rather than the owner of their firm. And a few enterprising venture capitalists, led by Jeff Bussgang in Boston and Brad Feld in Colorado, have launched programs that bring over foreign-born entrepreneurs to serve as “entrepreneurs in residence” at colleges and universities. Because nonprofit academic institutions are exempt from the H-1B cap, such entrepreneurs can secure their visas by working as mentors at a school, and then build their startups in their free time.

Trying to exploit flaws in the U.S. immigration system, countries around the world have enacted startup visas, often with the explicit purpose of luring away entrepreneurs who want to build a U.S. business but cannot get a visa to do so.

These innovative programs, which are currently available at 13 colleges and universities across the country, are already resulting in meaningful economic contributions. As of mid-2016, 23 entrepreneurs had secured visas through these programs nationally. The companies they founded had created 261 jobs and raised more than $100 million in funding.

### NUMBER OF EMPLOYEES AT IMMIGRANT-OWNED FIRMS

| 17,605 |
| people in Mississippi were employed at firms owned by immigrants in 2007. |

★ = 100 people
Immigrants in Mississippi play an important role contributing to the state as both taxpayers and consumers. In 2014, immigrant-led households in Mississippi earned $1.3 billion dollars—or 2.3 percent of all income earned by Mississippians that year. With those earnings, the state’s foreign-born residents, a small subset of the population overall, were able to contribute more than one in every 45 dollars paid by Mississippi residents in state and local tax revenues, payments that support important public services such as public schools and police. Through their individual wage contributions, immigrants also paid $185.6 million into the Social Security and Medicare programs that year.

By spending the money they earn at businesses such as hair salons, grocery stores, and coffee shops, immigrants also support small business owners and job creation in the communities where they live. In Mississippi immigrants held $1.0 billion in spending power in 2014, defined in this brief as the net income available to a family after paying federal, state, and local taxes. We highlight the spending power and tax contributions of several subsets of Mississippi’s foreign-born population below, including Hispanics and immigrants from Northern Africa or the Middle East.
In 2014, immigrants in Mississippi earned $1.3B.

Mississippi immigrants also contribute to our country’s entitlement programs. In 2014, through taxes on their individual wages, immigrants contributed $37.3M to Medicare and $148.3M to Social Security.

ENTITLEMENT CONTRIBUTIONS

- $112.3M — went to state and local taxes
- $245.4M — went to federal taxes

Leaving them with $1.0B in remaining spending power.
People who come to the United States often come here to work. Because of that, they often have skills that make them a good fit for our labor force—and a strong complement to American workers already here. In the country as a whole, immigrants are much more likely to be working-age than the U.S.-born. They also have a notably different educational profile. The vast majority of Americans—more than 79 percent of the U.S.-born population—fall into the middle of the education spectrum by holding a high school or bachelor’s degree. Immigrants, by contrast, are more likely to gravitate toward either end of the skill spectrum. They are more likely to lack a high school diploma than the native born, but also more likely to have an advanced degree. This makes them good candidates for labor-intensive positions, such as housekeeping, that many more educated U.S.-born workers are less interested in pursuing, as well as high-level positions that allow innovation-driven firms to expand and add jobs for Americans at all skill levels.

When it comes to educational attainment, immigrants in the state are 73.9% more likely to hold a graduate degree than natives.

Both these dynamics are strong in the state of Mississippi. When it comes to educational attainment, immigrants in the state are 73.9 percent more likely to hold a graduate degree than natives. They are also more than 87.9 as likely to be educated at less than a...
The foreign-born population is also strikingly more likely to be working age, which we define in this brief as ranging in age from 25 to 64. In Mississippi, 71.6 percent of the foreign-born population falls into that age band, while only 50.3 percent of the native-born population does. That 21.3-percentage point gap has major implications for the state’s workforce. In 2014, Mississippi’s immigrants were 50.7 percent more likely to be actively employed than the state’s native-born residents—a reality driven largely by the fact that a large share of the native-born population had already reached retirement age. Foreign-born individuals punched above their weight class as workers as well: In 2014, they made up 3.1 percent of all employed individuals in the state while accounting for 2.1 percent of Mississippi’s population overall.

The almost 63,000 immigrants who were living in Mississippi in 2010 were responsible for creating or preserving nearly 2,900 manufacturing jobs.

The contributions of New Americans in Mississippi | The Role of Immigrants in the Broader Workforce

The almost 63,000 immigrants who were living in Mississippi in 2010 were responsible for creating or preserving nearly 2,900 manufacturing jobs.

The immigrants who are working in Mississippi contribute to a wide range of different industries in the state—many of which are growing and important parts of the local economy. Foreign-born residents make up 8.7 percent of employees at the state’s colleges, universities, and professional schools. They also account for 8.4 percent of the state’s workers in animal slaughtering and processing, contributing to Mississippi’s sizeable food, beverage, and tobacco manufacturing industry, which added $1.9 billion to the state’s Gross Domestic Product (GDP) in 2014.9 Immigrants also frequently gravitate toward sectors where employers may struggle to find enough interested U.S.-born workers. Immigrants in Mississippi, for instance, make up 11.1 percent of workers in private households, an industry that includes maids and housekeepers.

In recent decades, immigrants have also played an important role in Mississippi’s overall manufacturing industry, the largest broad industry category in the state. Studies have found that the arrival of immigrants to a community can have a powerful impact creating or preserving manufacturing jobs. This is because foreign-born workers give employers access to a large and relatively affordable pool of laborers, making it less attractive for firms to move work to cheaper locations offshore. One study by the Partnership for a New American Economy and the Americas Society/Council of the Americas, for instance, found that every

9. Immigrants also frequently gravitate toward sectors where employers may struggle to find enough interested U.S.-born workers. Immigrants in Mississippi, for instance, make up 11.1 percent of workers in private households, an industry that includes maids and housekeepers.

In recent decades, immigrants have also played an important role in Mississippi’s overall manufacturing industry, the largest broad industry category in the state. Studies have found that the arrival of immigrants to a community can have a powerful impact creating or preserving manufacturing jobs. This is because foreign-born workers give employers access to a large and relatively affordable pool of laborers, making it less attractive for firms to move work to cheaper locations offshore. One study by the Partnership for a New American Economy and the Americas Society/Council of the Americas, for instance, found that every
time 1,000 immigrants arrive in a given U.S. county, 46 manufacturing jobs are preserved that would otherwise not exist or have moved elsewhere. The almost 63,000 immigrants who were living in Mississippi in 2010 were responsible for creating or preserving nearly 2,900 manufacturing jobs.

Aside from just looking at overarching industry groups, our work also examines the share of workers that are foreign-born in specific occupations and jobs. Immigrants in Mississippi, like the country as a whole, are often overrepresented in either high-skilled or particularly labor-intensive positions. While foreign-born workers make up 3.1 percent of the state’s employed population, they account for 14.0 percent of postsecondary teachers. They also make up 10.5 percent of those working as food service managers, and 12.7 percent of sewing machine operators.

Every winter, Melissa Edmondson sends a stream of paperwork along with a $4,000 check to a firm in Georgia that specializes in processing visas for seasonal immigrant labor.

The firm mails all the appropriate forms to all the appropriate agencies - state and federal offices scattered around the country - but Edmondson still needs to supply the data, about the farm, the work, the ads for local workers, the hours, the pay, the housing. The paperwork fills cases.

Two months later, the process starts again, for the next round of workers. And, three months later, again. Edmondson had to hire an assistant to handle the paperwork.

“It is very much a costly process, but it is one we couldn’t do without,” Edmondson says. “Were it not for the H-2A contract workers, we could forget about the sweet-potato farm.”

Edmondson’s family owns Topashaw Farms, in northeast Mississippi, and hires workers from Mexico using the H-2A visa, an immigration permit for seasonal agricultural labor.

But Edmondson always has to worry if the farm will have enough workers, thanks to an increasingly difficult labor situation.

In many ways hers is a typical American farm: 97 percent of America’s 2.1 million farms are family-owned, reports the U.S. Department of Agriculture. Edmondson married into Topashaw Farms in 1979, and helped her husband expand from 120 acres to 5,300 acres. They...
raise cattle, and grow sweet potatoes, soybeans, and corn.

Every year, the farm generates enough revenue to support four families, hers and those of her three grown children. They, in turn, all funnel money back into the economy, in the form of equipment, chemicals, boxes, and other farm supplies, along with groceries and household goods for themselves and their workers.

But Edmondson always has to worry if the farm will have enough workers, thanks to an increasingly difficult labor situation.

Like many farms in the country, her farm relies on immigrant labor. Nationally, 72.9 percent of field and crop workers were born abroad. The H-2A program she typically uses to bring in workers, however, has in recent years grown increasingly cumbersome and restrictive. “The last five to 10 years has been just atrocious,” she says.

Last year, workers scheduled to arrive March 1 to bed her sweet potatoes didn’t arrive until March 20, after the visa paperwork apparently got backed up on a government desk. Edmondson had to call her congressman to track it down and expedite the application. Similar delays last year cost farmers millions of dollars in lost crops nationwide. “It’s just been getting harder and harder to get migrant labor across the border,” says Edmondson, who recently saw a farm laborer who has worked in the country for 15 years face a visa denial.

Last year, workers scheduled to arrive March 1 to bed her sweet potatoes didn’t arrive until March 20, after the visa paperwork apparently got backed up on a government desk.

Edmondson, however, says she has few other options. Several years ago, she tried to hire local workers, which resulted in a situation she called “a nightmare.” Few, if any, workers apply for the arduous positions in the fields, and the handful that do typically don’t last the season. So instead, for now, she uses the H-2A visa program, providing the immigrant laborers $10.69 an hour and free housing.

She just hopes the immigration system becomes less cumbersome: “If it comes to the point of us not getting those workers, then we would have to downsize or shut down.”
Between 2014 and 2024, science, technology, engineering, and math—or “STEM”—fields are projected to play a key role in U.S. economic growth, adding almost 800,000 new jobs and growing 37.0 percent faster than the U.S. economy as a whole. Immigrants are already playing a huge part ensuring that Mississippi remains a leading innovator in STEM fields like utilities and advanced manufacturing. Despite making up 2.1 percent of the state’s population, foreign-born Mississippians made up 5.8 percent of STEM workers in the state in 2014. Our outdated immigration system, however, makes it difficult for STEM employers to sponsor the high-skilled workers they need to fill critical positions. This is problematic because it can slow the ability of firms to expand and add jobs for U.S.-born workers. It also makes little sense, given the country’s ongoing shortage of STEM talent—an issue that heavily impacts employers here. In 2014, 8.2 STEM jobs were advertised online in Mississippi for every one unemployed STEM worker in the state.

Despite making up 2.1% of the state’s population, foreign-born Mississippians represented 5.8% of all STEM workers in the state in 2014.

Immigrants, however, are not just a crucial piece of Mississippi’s STEM workforce now—they are also likely to power it in the future. In 2014 students on temporary visas made up roughly one out of every seven students earning a STEM Master’s degree at Mississippi’s universities, and 42.7 percent of students earning 10,182 available STEM jobs were advertised online in 2014, compared to 1,249 unemployed STEM workers.

The resulting ratio of open jobs to available workers was 8.2 to 1.

2,091 number of foreign-born STEM workers in Mississippi.
a PhD-level degree in STEM. Even after America’s universities invest in their education, however, many of those students struggle to remain in the country after graduation. Creating visa pathways that would make it easier for them to stay would have a major economic benefit to Mississippi. A study by the Partnership for a New American Economy and the American Enterprise Institute found that every time a state gains 100 foreign-born STEM workers with graduate-level STEM training from a U.S. school, 262 more jobs are created for U.S.-born workers there in the seven years that follow. For Mississippi, that means that retaining even half of the 244 graduates earning advanced-level STEM degrees in 2014 could result in the creation of 320 new positions for U.S.-born workers by 2021.

If half of Mississippi’s 244 advanced level STEM grads on temporary visas stayed in the state after graduation...

320 jobs for U.S.-born workers would be created by 2021.
Healthcare

In the coming years, the American healthcare industry is projected to see incredibly rapid growth—adding more new positions from 2014 to 2024 than any other industry in our economy. Already, caregivers are facing near unprecedented levels of demand. Between 2013 and 2015, the number of Americans with health insurance rose by almost 17 million, opening the door for many patients to receive more regular care. The country’s 76.4 million baby boomers are also aging rapidly—at a major cost to our healthcare system. Studies have found that elderly Americans spend three times more on healthcare services than those of working age each year.

Currently Mississippi has 195.1 practicing physicians per 100,000 people—a figure that ranks it third to last in the country in terms of physician coverage relative to other states.

MISSISSIPPI HAS A SHORTAGE OF HEALTHCARE WORKERS

15,673 available healthcare jobs were advertised online in 2014, compared to 3,887 unemployed healthcare workers.

The resulting ratio of open jobs to available workers was 4 to 1

Shortage of occupational therapists by 2030: 539

Shortage of dentists projected by 2025: 288
In Mississippi, a state where almost one out of every seven residents is currently elderly, finding enough healthcare workers remains a challenge—and one that will likely worsen in the future. Currently the state has 195.1 practicing physicians per 100,000 people—a figure that ranks it third to last in the country in terms of physician coverage relative to other states. The ratio of practicing psychiatrists per capita is also low. All this comes on top of shortages already impacting the state across the entire healthcare workforce. In 2014, four healthcare jobs were listed online in Mississippi for every one unemployed healthcare worker in the state. As baby boomers age a variety of other healthcare professions that cater largely to seniors, such as occupational therapists, will feel additional strain.

Immigrants are already playing a valuable role helping Mississippi meet some of its healthcare workforce gaps. In 2016 more than one in seven physicians in Mississippi graduated from a foreign medical school, a likely sign they were born elsewhere. Mississippi’s share of foreign-educated psychiatrists ranks in the top 20 nationwide. Immigrant healthcare practitioners also made up 2.0 percent of the state’s nurses in 2014, as well as 1.5 percent of those working as nursing, psychiatric, or home health aides.

In Mississippi, a state where almost one out of every seven residents is currently elderly, finding enough healthcare workers remains a challenge—and one that will likely worsen in the future. Immigrant families have long played an important role helping to build housing wealth in the United States. One study released by the Partnership for a New American Economy and Americas Society/Council of the Americas, for instance, found that in recent decades the country’s more than 40 million immigrants collectively raised U.S. housing wealth by $3.7 trillion. Much of this was possible because immigrants moved into neighborhoods once in decline, helping to revitalize communities and make them more attractive to U.S.-born residents.*

In Mississippi, immigrants are actively strengthening the state’s housing market. The roughly 13,000 foreign-born homeowners in the state held almost $2 billion in housing wealth in 2014. Immigrant-led households also generated 4.1 percent of the state’s rental income, even though they led only 2.2 percent of households in the state. Because Mississippi’s immigrants are more likely to be working age, they help address another major concern of housing experts as well—that the large wave of baby boomers retiring in the coming years could result in more homes going up for sale than there are buyers to purchase them. In a state where seniors already own 30.8 percent of homes, immigrant families made up 2.6 percent of new homebuyers from 2010 to 2014—a larger than expected portion given their share of the population.

Immigrants are bolstering the housing market by buying the wave of homes coming on the market as the baby boomers retire.

* Mississippi's immigrants are more likely to be working age, they help address another major concern of housing experts as well—that the large wave of baby boomers retiring in the coming years could result in more homes going up for sale than there are buyers to purchase them. In a state where seniors already own 30.8 percent of homes, immigrant families made up 2.6 percent of new homebuyers from 2010 to 2014—a larger than expected portion given their share of the population.
One key measure of the demand for immigrant workers involves the number of visas requested by employers in a given state. Before an employer can formally apply for many types of visas, however, it must first obtain “certification” from the Department of Labor—essentially a go-ahead from the DOL that the employer can apply for a visa to fill a given job or role. For the H-1B visa, which is used to sponsor high-skilled workers, an employer gains certification by filing what’s known as a Labor Condition Application, or LCA. In the LCA the employer must detail the position the foreign national would fill, the salary he would be paid, and the geographic location of the job. Firms must also attest that hiring an immigrant will not adversely impact similarly situated American workers. For two other large work visa categories—the H-2A for agricultural laborers and the H-2B for seasonal or temporary needs—employers file what is known as a Labor Certification application, or a “labor cert” for short. To get a labor cert approved, the employer must demonstrate that it is unable to locate an American worker that is available, willing, and able to fill the job.

* This includes only employment-based green cards

IF ALL APPROVED LCAS HAD TURNED INTO VISAS...

**868 LCAs** for H-1B workers could have created **1,588 jobs**.
In fiscal year 2014, Mississippi employers received DOL certification for more than 6,000 positions, including jobs across a wide variety of occupations and geographies within the state. They included almost 900 positions for potential workers on H-1B visas, as well as roughly 2,900 for H-2A workers. Federal officials also issued almost 2,200 certifications for H-2B visas, which are frequently used to staff places like hotels, fisheries, and stables during the high season. Given that it is expensive and cumbersome for employers to obtain labor certs—and similarly daunting to formally apply for an H-1B visa—the large interest in all these visa categories indicates Mississippi employers likely were having real trouble finding the workers they needed on U.S. soil.

Applying for certification, however, is not the same as receiving a visa. The H-1B program is currently capped at 85,000 visas a year for private sector employers. In the country as a whole, this resulted in almost half of all such applications being rejected in fiscal year 2014 alone. The H-2B program is similarly limited to just 66,000 visas per year. Even permanent immigrants get ensnared in the limitations of our outdated immigration system. Only seven percent of all green cards can go to nationals of any one country in a given year—resulting in backlogs lasting years for many Indian, Chinese, Mexican, and Filipino workers.17

In fiscal year 2014, Mississippi employers began the process of applying for more than 6,000 visas. These were for workers across a wide variety of occupations and geographies within the state.

When companies are denied the visas they need, company expansion is commonly slowed—often at a real and meaningful cost to the U.S.-born population. One study by the Partnership for a New American Economy and the American Enterprise Institute estimated that
when a state receives 100 H-2B visas, 464 jobs are created for U.S.-born workers in the seven years that follow. The fact that H-1B visa holders actually create—not take away—jobs from Americans has also been widely supported in the literature. A 2013 paper written by professors at Harvard University looking at the 1995 to 2008 period found that 1 additional young, high-skilled immigrant worker hired by a firm created 3.1 jobs for U.S.-born workers at that same company during the period studied. Other academics have tied each H-1B visa award or labor request with the creation of four or five American jobs in the immediate years that follow.

In this brief, we rely on a more conservative estimate of the impact of the H-1B program on the American workforce. Specifically, we use the estimate that every 1 additional H-1B visa awarded to a state was associated with the creation of 1.83 more jobs for U.S.-born workers there in the following seven years. On the first page of this section, we show the number of jobs that would have been created for U.S.-born workers in Mississippi by 2020 if all the fiscal year 2014 LCAs for H-1Bs had turned into actual visas.
Naturalization

Mississippi’s immigrants are not only living in the state, they are laying down roots in the state as well. Our analysis found that 37.1 percent of immigrants in Mississippi, or more than one in three of them, have already become naturalized citizens. Although that figure is lower than the naturalization rate for immigrants in the county as a whole, it still means that more than 23,400 immigrants in the state have taken that important step.

Like almost all parts of the country Mississippi is also home to a population of immigrants who are eligible to naturalize, but haven’t yet done so. Embracing public policies that would help those individuals navigate the naturalization process could have an important economic impact on the state. Studies have found that immigrants who become citizens seek out higher education at greater rates than non-citizens. Because citizenship allows immigrants to pursue a greater range of positions, including public and private sector jobs requiring a security clearance, it also has been found to raise a person’s annual wages. One study by researchers at the University of Southern California pegged the size of that wage increase at 8 to 11 percent. If the average non-citizen in Mississippi saw a wage boost at the low end of that range, or 8 percent, she would earn almost $1,800 more per year—money that could be reinvested in the state’s economy through her spending at local businesses. Multiplied by the roughly 23,000 non-citizens in Mississippi currently eligible to naturalize, such policy initiatives could collectively boost wages in the state by almost $41 million.

22,924
Number of non-citizens eligible to naturalize in 2014

The average non-citizen in Mississippi earns $22,083 per year. If they naturalized, they each could earn an average of $1,767 more per year.

$40.5M
Aggregate additional earnings if eligible non-citizens naturalized.
Policymakers are increasingly realizing that international students provide huge benefits to the communities where they live and study. The World Bank has found that an increase in the number of international graduate students studying at American schools leads to large boosts in the number of patents awarded to local research universities in the years that follow. Through their tuition payments and day-to-day spending, international students in the broader United States also contributed more than $30.5 billion to the U.S. economy in the 2014-2015 school year and supported more than 370,000 jobs.

In Mississippi, the roughly 3,200 international college students studying on temporary visas make up just 1.9 percent of all college students in the state. Still, their economic contribution is meaningful. They support more than 700 jobs in the state, including positions in transportation, health insurance, and retail.

Through their tuition payments and day-to-day spending, international students in the broader United States also contributed more than $30.5B to the U.S. economy in the 2014-2015 school year and supported more than 370,000 jobs.

International students represent a very small portion of all students in Mississippi, but they make a big impact...

- International students make up only 2% of all students in Mississippi.
- Economic contribution of international students to the state, 2015: $68.2M
- Jobs supported by international students, 2015: 738
Immigrants in Mississippi do not only make a difference to the state’s economy, they also play a role at the voting booth. In 2014, Mississippi was home to almost 22,000 foreign-born residents who were eligible to vote, including an estimated 10,000 foreign-born residents who had formally registered. Those numbers are unlikely to sway a presidential election in this relatively safe Republican state, where Republican presidential candidate Mitt Romney won by roughly 148,000 votes in 2012. Still, it can make a difference in closer statewide contests and primaries.

Going forward, immigrants will likely continue to gain voting power in Mississippi. Based on voting participation patterns in recent years, we would expect almost 6,000 foreign-born voters to cast formal ballots in the presidential election this year. An additional 5,000 more immigrants will either naturalize or turn 18 by 2020, expanding the pool of eligible new American voters in Mississippi to almost 25,000 people.

*Margin not drawn to scale.*
The United States is currently home to an estimated 11.4 million undocumented immigrants, the vast majority of whom have lived in the United States for more than five years. The presence of so many undocumented immigrants in our country for such a long time presents many legal and political challenges that are beyond the scope of this report. But while politicians continue to debate what to do about illegal immigration without any resolution, millions of undocumented immigrants are actively working across the country, and collectively, these immigrants have a large impact on the U.S. economy. One recent study found that 86.6 percent of undocumented males in the country were employed in 2012 and 2013, suggesting that most immigrants who come here illegally do so because of work opportunities.

And because employers are required by law to gather Social Security numbers for all their hires, many undocumented individuals are paying into our tax system as well—often under falsified or incorrect Social Security numbers. These undocumented immigrants generally lack access to federal aid programs such as Medicaid, food stamps, and Temporary Assistance for Needy Families, so they also draw down far less from these programs than their native-born counterparts.

One recent study found that 86.6% of undocumented males in the country were employed in 2012 and 2013, suggesting that most immigrants who come here illegally do so because of work opportunities.

Of course, there are many compelling reasons that having a large undocumented population is a problem for a society. It undermines law and order, permits a shadow economy that is far harder to regulate, and is simply unfair to the millions of people who have come here legally. But as the undocumented immigration problem has gone largely unaddressed for the past 30 years, undocumented workers in the country have begun to play an increasingly integral role in many U.S. industries. In some sectors, such as agriculture, undocumented immigrants account for 50 percent of all hired crop workers, making them a critical reason why the industry is able to thrive on U.S. soil. Many studies have also indicated that these undocumented workers are not displacing the U.S.-born, but rather, taking jobs few Americans are interested in pursuing. Economists have found that low-skilled immigrants, the group that most undocumented immigrants fall into, tend to pursue different jobs than less-skilled natives. While U.S.-born workers without a high school degree are often overrepresented in forward-facing roles like cashiers, receptionists, and coffee shop attendants, many less-skilled immigrants pursue more labor-intensive work requiring less human interaction, filling jobs as meat processors, sewing machine operators, or nail salon workers. This phenomenon exists within
industries as well. In construction, for instance, less-skilled immigrants often work as painters and drywall installers, allowing natives to move into higher paying positions requiring more training, such as electricians, contractors, and plumbers.\textsuperscript{28}

The challenge of undocumented immigration is becoming increasingly apparent in places like Mississippi, which have not historically been home to a large number of such immigrants. But just as with the nation as a whole, as these immigrants spend years and decades in America, they get further integrated into our economy. In Mississippi, there is evidence that undocumented immigrants are playing a small but critical role in the workforce. In this section, we estimate the size and the characteristics of the undocumented population in Mississippi by conducting a close analysis of the American Community Survey from the U.S. Census. This work uses a series of variables to identify immigrants in the survey who are likely to lack legal status—a method that has recently emerged in the academic literature on immigration.\textsuperscript{29} (See the Methodology Appendix for more details.)

Using this technique, we estimate that Mississippi is home to almost 23,000 undocumented immigrants. These individuals are far more likely than the native-born population—or even the broader foreign-born one—to be in the prime of their working years, or ranging in age from 25-64. They also contribute to a range of industries that could not thrive without a pool of workers willing to take on highly labor-intensive roles. In 2014, for instance, undocumented immigrants made up 3.8 percent of all employees in Mississippi’s accommodation and food services industry, a sector that includes dishwashers, food preparation workers, and short order cooks. They also made up 3.2 percent of workers employed in the agricultural sector, as well as 4.3 percent of workers in the construction industry.

Large numbers of undocumented immigrants in Mississippi have also managed to overcome licensing and financing obstacles to start small businesses. In 2014, an estimated 12.9 percent of the state’s working-age undocumented immigrants were self-employed—meaning Mississippi was one of roughly two dozen states where unauthorized immigrants boasted higher rates of entrepreneurship than either legal permanent residents or immigrant citizens of the same age group. Roughly 2,000 undocumented immigrants in Mississippi were self-employed in 2014, many providing jobs and

\end{table}
In 2014, undocumented immigrants in Mississippi earned $252.9M.

$12.4M — went to state and local taxes
$16.6M — went to federal taxes

Leaving them with $224M in remaining spending power.

Entitlement Contributions

Undocumented immigrants also contribute to our country’s entitlement programs. In 2014, through taxes on their individual wages, undocumented immigrants contributed $5.2M to Medicare and $21.4M to Social Security.
economic opportunities to others in their community. Undocumented entrepreneurs in the state also earned an estimated $47.5 million in business income that year.

The larger political debate around the economic cost or benefits of undocumented immigration tends to focus on the expense of educating immigrant children or the healthcare costs associated with increased use of emergency rooms and other services. These costs are real and can be substantial, but taken alone they paint an incomplete picture of the impact of undocumented immigration. This is because the debate infrequently recognizes that since most undocumented immigrants are working, they make large federal and state tax contributions and frequently are net contributors to many of our most important—and most imperiled—benefits programs. Social Security’s Chief Actuary, for example, has credited unauthorized immigrants with contributing $100 billion more to Social Security than they drew down in benefits during the last decade. Several in-depth studies at the state level have similarly come to the conclusion that undocumented immigrants represent a net benefit to the states in which they live. One paper, from researchers at Arizona State University, estimated that undocumented immigrants in that state pay $2.4 billion in taxes each year—a figure far eclipsing the $1.4 billion spent on the law enforcement, education, and healthcare resources they use. Another study estimated that, on a per capita basis, Florida’s undocumented immigrants pay $1,500 more in taxes than they draw down in public benefits each year.

Although we are currently unable to calculate the amount spent on any public benefits or services used by undocumented immigrant families, we can gain a fairly clear sense of the amount they are paying in taxes each year. A variety of studies have estimated that anywhere from 50 to 80 percent of households led by undocumented immigrants file federal income taxes annually. Federal government officials have also estimated that 75 percent of undocumented workers have taxes withheld from their paychecks. In this paper, we make the assumption that 50 percent of the country’s undocumented households paid income taxes in 2014. Although many experts would call this share highly conservative, it has been modeled in several academic papers, and also by think tanks that specialize exclusively in the study of U.S. tax policy.

In 2014, we estimate that Mississippi households led by undocumented immigrants earned more than $252.9 million in income. Of that, they paid an estimated $16.6 million in federal taxes. They also contributed roughly $21.4 million directly to the Social Security program through taxes on their individual wages. Mississippi’s undocumented immigrants also made an important impact through their state and local tax contributions—money that many localities use to pay for police forces, public education, and city services like garbage collection and recycling. We estimate that Mississippi’s undocumented immigrants paid almost $12.4 million in state and local taxes in 2014.

In 2014, we estimate that Mississippi households led by undocumented immigrants earned more than $252.9M in income.

Giving legal status to undocumented immigrants would increase their access to a variety of public benefits—resulting in potentially higher costs for federal, state, and local governments. But because legalization is expected to raise the earning power of undocumented immigrants and give them access to a wider array of jobs and educational opportunities, it would have the opposite effect as well, potentially allowing them to spend more as consumers and pay more in taxes each year. Provisions within immigration reform requiring that undocumented immigrants pay any back taxes before normalizing their status would temporarily boost U.S. tax revenues still further.

But while the debate over legalization continues without resolution, the data suggests that the undocumented immigrants in Mississippi have largely assimilated into the United States, making it less likely that mass
deportation will ever be a realistic option. We estimate that 77.3 percent of the state’s undocumented population has been in the United States for five or more years. More than 61.6 percent speak English well, very well, or fluently. Studies show that when immigrants with limited English proficiency learn the language, they see a substantial wage benefit and become less isolated in their communities. The labor market outcomes and educational levels of their children increase with time as well.
Methodology

The vast majority of data that appears in this brief was calculated by the Partnership for a New American Economy research team, using a variety of publicly available data sources. Our work relied most heavily on the 2014 American Community Survey (ACS) 1-year sample using the Integrated Public Use Microdata Series (IPUMS) database. Unless otherwise noted this data is weighted using the person weight for analysis at the individual level, and is weighted using the household weight for analysis at the household level.

Demographics

The data points on the foreign-born population in the demographics section are calculated using both the 2010 and 2014 ACS 1-year sample.

Entrepreneurship

The data on self-employed immigrants and the business income generated by immigrant entrepreneurs come from the 2014 ACS 1-year sample. We define immigrants as foreign-born individuals (excluding those that are children of U.S. citizens or born on U.S. territories).

The number of employees at immigrant-owned firms is estimated by using the 2007 Survey of Business Owners (SBO) Public Use Microdata Sample (PUMS), which is the most recent microdata on business owners currently available. The estimates are weighted using the tabulation weights provided in the dataset. We define immigrant-owned businesses as firms with at least one foreign-born owner. For confidentiality, the data exclude businesses classified as publicly owned firms because they can be easily identified in many states. Based on our own analysis, we believe that many of the publicly owned firms excluded from this data are companies with 500 employees or more. As a result, the final number of employees at immigrant-owned companies in this report is a conservative estimate, and is likely lower than the true value.

Fortune magazine ranks U.S. companies by revenue and publishes a list of top 500 companies and their annual revenue as well as their employment level each year. To produce our estimates, we use the 2015 Fortune 500 list. Our estimates in this section build on past work done by PNAE examining each of the Fortune 500 firms in the country in 2011, and determining who founded them. We then use publicly available data, including historical U.S. Census records and information obtained directly by the firms, to determine the background of each founder. In the rare cases where we could not determine a founder’s background, we assumed that the individual was U.S.-born to be conservative in our estimates. Some firms created through the merger of a large number of smaller companies or public entities were also excluded from our analysis. These included all companies in the utilities sector and several in insurance.

To produce the Fortune 500 estimates for each state, we allocate firms to the states where their current headquarters are located. We then aggregate and report the annual revenue and employment of the firms in each state that we identify as “New American” Fortune 500 companies. These are firms with at least one founder who was an immigrant or the child of immigrants.

Income and Tax Contributions

Using the 2014 ACS 1-year data, we estimate the aggregate household income, tax contributions, and spending power of foreign-born households.
To produce these estimates, a foreign-born household is defined as a household with a foreign-born household head. Immigrant sub-groups are defined as follows: 1) Asian immigrants refer to the foreign-born persons who self identify as Chinese, Taiwanese, Japanese, Filipino, Asian Indian, Korean, Native Hawaiian, Vietnamese, Bhutanese, Mongolian, Nepalese, Cambodian, Hmong, Laotian, Thai, Bangladeshi, Burmese, Indonesian, Malaysian, Pakistani, Sri Lankan, Samoan, Tongan, Guamanian/Chamorro, Fijian, or other Pacific Islanders; 2) Hispanic immigrants include those foreign-born persons who report their ethnicity as Hispanic; 3) Immigrants grouped under Sub-Saharan Africa originate from African countries, excluding the North African countries of Egypt, Libya, Tunisia, Algeria, and Morocco; 4) Middle Eastern and North African immigrants are foreign-born persons from North Africa as well as the following Middle Eastern countries: Iran, Iraq, Bahrain, Israel, Jordan, Kuwait, Lebanon, Oman, Palestine, Qatar, Saudi Arab, Syria, United Arab Emirates, and Yemen.

In this brief, mirroring past PNAE reports on this topic, we use the term “spending power.” Here and elsewhere we define spending power as the disposable income leftover after subtracting federal, state, and local taxes from household income. We estimate state and local taxes using the tax rates estimates produced by Institute on Taxation and Economic Policy by state income quintiles. For federal tax rate estimates, we use data released by the Congressional Budget Office in 2014 and calculate the federal tax based on the household income federal tax bracket.

Social Security and Medicare contributions are drawn from taxes on an individual’s wage earnings. This is far different from a household’s overall income, which may include other revenue streams such as rental income and returns on investments. To account for this difference between overall federal taxes and Social Security and Medicare contributions, we estimate Medicare and Social Security contributions based on wage and salary data provided at the individual level in the ACS. For self-employed individuals, we use the self-employment income as the income base. The amount of earnings that can be taxed by the Social Security program is capped at $117,000, while there no such limit for the Medicare program. We use a flat tax rate of 12.4 percent to estimate Social Security contributions and 2.9 percent for to capture Medicare contributions. This estimates the total amount that immigrants and their employers contributed in 2014.

It is also worth noting that half of the amount contributed to Social Security and Medicare (6.4 percent of Social Security tax rate and 1.45 percent of Medicare tax rate) comes from individual workers, while the other half comes directly from their employers. Self-employed workers have to pay the full tax themselves. When estimating Social Security and Medicare contributions, we include all individual wage earners in the households and aggregate the amount paid by state.

### Workforce

We use the 2014 ACS 1-year sample to estimate all data points in the workforce segment of the report. We define the working age population as those 25 to 64 years old. When estimating how much more foreign-born persons are likely to be employed than native-born persons, however, we calculate the percentage of native-born and foreign-born residents of all ages who were employed in 2014. The reason why we choose a more inclusive population for that estimate is because we want to make the point that the increased likelihood of being working aged that we see among immigrants leads to higher employment in the vast majority of states.

Because the employment status of people who are 16 years old or younger is not available in the ACS, we assume that these young people are not employed. The employed population also does not include those in the Armed Forces.

To estimate how much more likely immigrants are to be employed than natives, we calculate the percent difference between the immigrant and native-born employment rates. Our estimates on the share of immigrants and natives of different education levels only take into consideration individuals aged 25 or older.
The North American Industry Classification System, or NAICS Industry code, is used to estimate the industries with the largest share of foreign-born workers. All individuals 16 years old and above are included in these calculations. The total number of workers for certain industries in some states is extremely small, thus skewing results. In order to avoid this, we calculate the percentile distribution of the total number of workers per industry per state and drop the industries in each state that fall below the lowest 25th percentile. Estimated occupations with the largest share of foreign-born workers per state also follow the same restrictions—the universe is restricted to workers age 16 and above, and the occupations per state that fall under the 25th percentile benchmark are not included.

Our estimates on the number of manufacturing jobs created or preserved by immigrants rely on a 2013 report by the Partnership for a New American Economy and the Americas Society/Council of the Americas. That report used instrumental variable (IV) strategy in regression analysis and found that every 1,000 immigrants living in a county in 2010 created or preserved 46 manufacturing jobs there. We use that multiplier and apply it to the 2010 population data from the ACS to produce our estimates.

**Agriculture**

We access the agriculture GDP by state from Bureau of Economic Analysis, which includes GDP contributions from the agriculture, forestry, fishing, and hunting industry. The share of foreign-born agricultural workers is estimated using 2014 ACS 1-year sample. Additional data on agriculture output, top three crops per state, and leading agricultural exports come from United State Department of Agriculture (USDA)’s state fact sheets. When displayed, data on sales receipts generated by the top fresh produce items in each state come the Farm and Wealth Statistics cash receipts by commodity tables available from the USDA’s Economic Research Service.

The agriculture section uses the Quarterly Census of Employment and Wage (QCEW) to estimate the percentage of crop farms producing fresh fruits and vegetables, and change in real wage of agricultural workers between 2002 and 2014. The QCEW data uses the North American Industry Classification System (NAICS) to assign establishments to different industries. We identify the following farms as fresh fruits and vegetable farms: other vegetable and melon farming, orange groves, citrus, apple orchards, grape vineyards, strawberry farming, berry farming, fruit and tree nut combination farming, other non-citrus fruit farming, mushroom production, other food crops grown under cover, and sugar beet farming.

The decline in the number of field and crop workers comes from the quarterly Farm Labor Survey (FLS) administered by USDA. Stephen Bronars, an economist with Edgeworth Economics, previously analyzed and produced these estimates for the PNAE report, “A Vanishing Breed: How the Decline in U.S. Farm Laborers Over the Last Decade has Hurt the U.S. Economy and Slowed Production on American Farms” published in 2015. Additional information on those calculations can be found in the methodology section of that paper.

Finally, for a small number of states, we also produce estimates showing how growers in the state are losing market share for specific produce items consumed each year by Americans, such as avocados or strawberries. Those estimates originate in a 2014 report produced by PNAE and the Agriculture Coalition for Immigration Reform. The author used data from the USDA's annual “yearbook” for fresh fruits and vegetables, among other sources, to produce those estimates. More detail can be found in the methodology of that report.

**Science, Technology, Engineering, and Math**

We use the STEM occupation list released by U.S. Census Bureau to determine the number and share of foreign-born STEM workers as well as the number of unemployed STEM workers from 2014 ACS 1-year data. Per U.S. Census classification, healthcare workers such as physicians and dentists are not counted as working in
the STEM occupations. All unemployed workers who list
their previous job as a STEM occupation are counted as
unemployed STEM workers.

To capture the demand for STEM workers, we use
the Labor Insight tool developed by Burning Glass
Technologies, a leading labor market analytics firm.
Burning Glass, which is used by policy researchers
and academics, scours almost 40,000 online sources
daily and compiles results on the number and types
of jobs and skills being sought by U.S. employers. This
search includes online job boards, individual employer
sites, newspapers, and public agencies, among other
sources. Burning Glass has an algorithm and artificial
intelligence tool that identifies and eliminates duplicate
listings—including ones posted to multiple job boards as
part of a broad search.19

The data on STEM graduates are from the 2014
Integrated Postsecondary Education Data System (IPEDS)
completion survey.20 A study by the Partnership for a
New American Economy and the American Enterprise
Institute found that every time a state gains 100 foreign-
born STEM workers with graduate-level STEM training
from a U.S. school, 262 more jobs are created for U.S.-
born workers there in the seven years that follow.21 We use
this multiplier and the number of STEM advanced level
graduates on temporary visas to estimate the number of
jobs created for U.S.-born workers.

The last part of the STEM section presents data on
patents with at least one foreign-born inventor. The
data is originally from a study by Partnership for a New
American Economy in 2012, which relied on data from
U.S. Patent and Trademark Office’s database as well as
LinkedIn, direct correspondence, and online profiles to
determine the nativity of individual inventors.22

Healthcare

We estimate the number of unemployed healthcare
workers using the 2014 ACS 1-year sample. Healthcare
workers are healthcare practitioners and technical
occupations, or healthcare support occupations as
defined by U.S. Census Bureau.23

Unemployed healthcare workers are individuals who
report their previous job as a healthcare occupation, and
their employment status as currently not working but
looking for work. We took the number of job postings
for healthcare workers from the Burning Glass Labor
Insight tool, a database that scours online sources and
identifies the number and types of job postings. We
describe this resource in detail in the section on STEM
methodology.

We then delve into specific occupations within the
broader healthcare industry. To produce the figures
on the total number of physicians and psychiatrists
and the share born abroad, we use American Medical
Association (AMA) Physician Masterfile data. To give
a sense of the supply and demand of physicians and
psychiatrists, we also calculate the physician and
psychiatrist density in each state by dividing the total
number of physicians or psychiatrists by the population
estimates in 2015 for each state.24 As for the share of
foreign-born nurses and home health aides, we use
the 2014 ACS 5-year sample data because data from the
1-year sample is too small to make reliable estimates.

We estimate the shortage of psychiatrists, dentists, and
occupational therapists using data from the various
U.S. government offices. For example, the shortage of
psychiatrists refers to the current lack of psychiatrists
per the U.S. government’s official definition of a mental
health shortage area (1/30,000 residents) in each
county, aggregated within each state.25 The shortage
of dentists is from an analysis by U.S. Department
of Health and Human Services,26 and the shortage of
occupational workers is from a journal article published
by PM&R, the official scientific journal of the American
Academy of Physical Medicine and Rehabilitation.27 For
psychiatrists, we project future shortages by accounting
for individuals in these occupations as they reach the
retirement age of 65.

Housing

The data in the housing section comes from the 2014
ACS 1-year sample. Immigrant homeowners are defined
as foreign-born householders who reported living in
their own home. We estimate the amount of housing wealth held by immigrant households by aggregating the total housing value of homes owned by immigrant-led households. We also estimate the amount of rent paid by immigrant-led households by aggregating the rent paid by such families. We then calculate the share of housing wealth and rent that immigrant households held or paid compared to the total population. For characteristics of homeowners, a foreign-born new homebuyer is defined as a household with a foreign-born household head who owned and moved to the current residence within the last five years.

**Visa Demand**

The data on visa demand are drawn primarily from the 2014 Annual Report produced by the Office of Foreign Labor Certification within the U.S. Department of Labor. Our figures on the number of visa requests authorized for each state—as well as the occupations and cities those visas are tied to—originate directly from that report.

In this section, we also present estimates on the number of jobs that would have been created if all the visas authorized in 2014 had resulted in actual visa awards. The multipliers we use to produce these estimates originate in a 2011 report released by PNAE and the American Enterprise Institute. That report, written by the economist Madeline Zavodny, used a reduced-form model to examine the relationship between the share of each state’s population that was immigrant and the employment rate of U.S. natives. More detail on Zavodny’s calculations and the multipliers produced for each visa type can be found in the methodology appendix of that report.

For purposes of these briefs, we use Zavodny’s finding that the award of 100 additional H-1B visas in a state is tied to 183 additional jobs for natives there in the 7 years that follow. The award of 100 additional H-2B visas creates 464 additional jobs for natives in the state during that same time period. We apply these multipliers to the number of visas in those categories authorized for each state in 2014.

In many of the state reports, we also present figures showing how visa denials resulting from the 2007 and 2008 H-1B lotteries cost the tech sectors of metropolitan areas both employment and wage growth in the two years that followed. The economists Giovanni Peri, Kevin Shih, and Chad Sparber produced these estimates for a PNAE report on the H-1B visa system that was released in 2014. That report relied on Labor Condition Application and I-129 data that the authors obtained through a Freedom of Information Act request, as well as American Community Survey data from 2006 and 2011. The authors did regressions that examined the causal relationship between a “shock” in the supply of H-1B computer workers and computer employment in subsequent years for more than 200 metropolitan areas. More information on those estimates can be found in the methodology appendix of that report.

**Naturalization**

Using the ACS 2014 1-year sample, non-citizens eligible to naturalize are defined as non-citizens who are 18 years or above, can speak English, and have continuous residence in the United States for at least five years.

Researchers at the University of Southern California’s Center for the Study of Immigrant Integration published a report in 2012, “Citizen Gain: The Economic Benefits of Naturalization for Immigrants and the Economy,” which concluded that immigrants experience an 8 to 11 percent gain in their individual wages as a result of becoming naturalized. Because this earnings gain phases in over time—and we want to be conservative in our estimates—we model a wage increase of just 8 percent when discussing the possible gains that could accrue due to naturalization. We use this multiplier and the mean individual wages of non-citizens in each state to estimate the additional earnings that non-citizens would earn if they naturalized. Finally, we calculate the aggregate wage earnings boost by multiplying the total number of non-citizens who are eligible for naturalization by the average increase in wage income per person.
International Students

We obtain the size and share of postsecondary students who are international in each state from the 2014 Integrated Postsecondary Education Data System (IPEDS) fall enrollment data. Those figures are then applied to preexisting work previously done by NAFSA, an organization representing professionals employed in the international offices of colleges and universities across the United States. NAFSA has developed an economic value tool and methodology that estimates the total economic benefit and jobs created or supported by international students and their dependents in each state. The economic contributions include the costs of higher education along with living expenses minus U.S.-based financial support that international students receive.

Because the enrollment data from IPEDS that we use in this brief is different from the underlying data used by NAFSA, our figures differ slightly from the NAFSA estimates of the economic contributions made by international students in the 2014-2015 school year.

Voting

The estimates for the number of registered and active voters who are foreign-born are calculated from the Voter Supplement in the Current Population Survey (CPS) for the years 2008, 2010, 2012, and 2014 using the IPUMS database. The sample in CPS includes civilian non-institutional persons only. Foreign-born individuals who stated having voted between 2008 and 2014 are termed active voters.

Using data from the 2014 ACS 1-year sample, we estimate the number and share of foreign-born eligible voters. We define them as naturalized citizens aged 18 or older who live in housing units. Persons living in institutional group quarters such as correctional facilities or non-institutional group quarters such as residential treatment facilities for adults are excluded from the estimation. We also estimate the number of new foreign-born voters who will become eligible to vote in 2016 and 2020, either by turning 18 or through naturalization, as well as the total number of foreign-born voters in these years. The estimates of newly eligible voters for 2016 include naturalized citizen ages 16 and 17 as of 2014 (thereby becoming of voting age by 2016). Those eligible to vote in 2020 include all naturalized citizens ages 12-17 in 2014. Applicable mortality rates are also applied. In addition, we estimate newly naturalized citizens using data from the Department of Homeland Security, which show the two-year average of new naturalized citizens by state. We discount from these numbers the percentage of children below 18 in households with a naturalized householder by state. Estimates of total foreign-born voters include naturalized citizens aged 18 or older in 2014, discounted by average U.S. mortality rates by age brackets, summed to the pool of newly eligible foreign-born voters.

Margin of victory in 2012 refers to President Barack Obama’s margin of victory over Republican candidate Mitt Romney in terms of popular vote. The margins are negative in states that Romney won in 2012.

Undocumented

Using data from the 2014 ACS, we applied the methodological approach outlined by Harvard University economist George Borjas to arrive at an estimate of the undocumented immigrant population in the overall United States and individual states. The foreign-born population is adjusted for misreporting in two ways. Foreign-born individuals who reported naturalization are reclassified as non-naturalized if the individual had resided in the United States for less than six years (as of 2014) or, if married to a U.S. citizen, for less than three years. We use the following criteria to code foreign-born individuals as legal U.S. residents:

- Arrived in the U.S. before 1980
- Citizens and children less than 18 year old reporting that at least one parent is native-born
- Recipients of Social Security benefits, SSI, Medicaid, Medicare, Military insurance, or public assistance
Households with at least one citizen that received SNAP
People in the armed forces and veterans
People attending college and graduate school
Refugees
Working in occupations requiring a license
Government employees, and people working in the public administration sector
Any of the above conditions applies to the householder’s spouse

The remainder of the foreign-born population that do not meet this criteria is reclassified as undocumented. Estimates regarding the economic contribution of undocumented immigrants and the role they play in various industries, and tax contributions are made using the same methods used to capture this information for the broader immigrant population in the broader brief. When estimating the aggregate household income, spending power, and tax contributions, we are not able to make reliable estimates for undocumented-led households in Alaska, Maine, Montana, North Dakota, South Dakota, Vermont, and West Virginia due to the small sample size of undocumented-led households in ACS. Finally, the variables giving a sense of the undocumented population’s level of assimilation—including their English proficiency and time in the United States—are estimated by examining the traits of the undocumented population in the 1-year sample of the ACS.

These positive benefits have been documented despite well-known problems regarding the H-1B visa system. The safeguards to protect American workers have not been updated since 1998, opening the door to increased use of the visa by a small number of outsourcing firms. This has left many U.S. companies with no reliable avenue to bring in the top talent they need to grow. PNAE has long advocated for legislation that would reform the H-1B program, including the recently introduced Protect and Grow American Jobs Act.
